Patio Heater Lighting Instructions

1. Make sure a propane tank is attached to the Hose/Regulator and the valve is in the **OPEN POSITION**.
2. You must **BLEED THE LINE** (depress the control knob in the "PILOT" Position) each time you change tanks or if the heater is not used for an extended period of time for a **MINIMUM OF 45-60 SECONDS**. This allows the fuel to push out the oxygen in the feed line. It may take longer than this due to wind conditions.
3. Only depress the red igniter button **AFTER BLEEDING THE LINE, NOT BEFORE**. It will not light if you hit the igniter immediately after pushing in the control knob at the "PILOT" position.
4. Once the pilot is lit, continue to hold the control knob in for **5/6 SECONDS** to allow the thermocouple to heat up.
5. Allow the control knob to spring back out to the standard position and switch to "ON" to engage the main burner. **DO NOT TURN IT BACK TOWARDS THE "OFF" SETTING** or you will turn the unit off and have to restart the entire process.
6. As the emitter grid begins to show an **ORANGE COLOR** over time, this can be cleaned with a damp towel. This material is soot and can clog the emitter grid plus the burner. When not in use, once a week, use compressed air to blow out the build up in the head and valve/pilot area.
